# Estimation of Rotational Temperature of the 1-1 Band of $\mathrm{B}^{2} \Sigma^{+}-\mathrm{X}^{2} \Sigma^{+}$System of AIO Molecule <br> C. T. Londhe ${ }^{1}$ <br> ${ }^{1}$ Department of Physics, Mahatma Gandhi Mahavidyalaya, Ahmedpur, Maharashtra, India 

#### Abstract

The $\mathrm{B}^{2} \Sigma^{+}-\mathrm{X}^{2} \Sigma^{+}$transition of AlO molecule was recorded on BOMEM DA8 Fourier Transform Spectrometer at a resolution of $0.05 \mathrm{~cm}^{-1}$. The intensities of well-resolved rotational lines of $\mathrm{R}_{1}$ and $\mathrm{R}_{2}$ of (1-1) band of the $\mathrm{B}^{2} \Sigma^{+}-\mathrm{X}^{2} \Sigma^{+}$ transition of AlO molecule were measured. The average rotational temperature estimated from these lines is 1925 K .

Keywords: Intensity measurement, Rotational temperature, AlO molecule.

## I. INTRODUCTION

The vibrational and rotational temperature derived from the band spectra are of importance in spectroscopy, chemical physics, thermodynamics etc. Since AlO has astrophysical significance, spectroscopic temperature of AlO molecules is of interest [1-12]. Mentall \& Nicholls [13] derived the vibrational temperature of AlO using laser produced plasma. Recently Dores, et al [14] also determined the vibrational temperature using laser ablation technique. They used the 266 nm radiation from a Nd: YAG laser and the alumina $\mathrm{Al}_{2} \mathrm{O}_{3}$ as a target. Chaudhari, et al [15] also determine rotational temperature using dc arc discharge. They use dc arc in air running between two aluminium electrodes of about 1 cm in diameter and tapered towards tips. The arc current was 3 A at 110 V . The $\mathrm{B}^{2} \Sigma^{+}-\mathrm{X}^{2} \Sigma^{+}$system of AlO was photographed in the first order of a 10.6 m concave
grating spectrograph. Recently Behere and et al [16] and Londhe et al[17] determined rotational temperature of $0-1$ and (1-0) band of the $B^{2} \Sigma^{+}-\mathrm{X}^{2} \Sigma^{+}$ transition of AlO molecule measured using microwave discharge method.
In present study the rotational temperature of AlO is estimated by exciting the molecule in the microwave.

## II. EXPERIMENTAL

The AlO molecule was excited using a microwave discharge. A narrow quartz tube of 0.8 cm diameter was found optimum. Aluminium trichloride vapors along with oxygen and argon gases were allowed to flow in the tube. A small quartz boat containing $\mathrm{AlCl}_{3}$ was sealed in a side tube. A moderate heating of $\mathrm{AlCl}_{3}$ sample and flowing argon at a pressure of 10 torr gave a blue green glow when a microwave power (2450 $\mathrm{MHz}, 150$ watt) power was applied to a discharge tube.

In order to stop the possibility of $\mathrm{AlCl}_{3}$ vapors going to pump oil, a liquid nitrogen trap was connected between the discharge tube and the rotary pump. The gas pressures were so optimized as to give very intense characteristic glow of AlO [18]. A spherical lens was used to focus the emission signal into the interferometer. The spectra in the region 18000 $22000 \mathrm{~cm}^{-1}$ were recorded with BOMEM DA8 Fourier transform spectrometer with an apodized resolution of $0.05 \mathrm{~cm}^{-1}$ using quartz UV beam splitter and silicon detector. The emission signal being strong no filter was required. Fifty scans (integration time ${ }^{\sim} 75 \mathrm{~min}$.) were co added to obtain an improved signal-to-noise ratio [17]. The prints of the traces of $(1,1)$ bands are shown in Fig. 1. The areas of the profiles of the rotational lines were measured with the help of a digital plannimeter with an accuracy of $10^{-2} \mathrm{~cm}^{2}$ and more. Intensity measurement of rotational lines of $(1,1)$ band shown in table 1 . To avoid the congregation of point's graph of $\mathrm{R}_{1}$ and $\mathrm{R}_{2}$ lines for
each band is shown separately in Fig. 2 and Fig. 3 respectively. From the slope of each graph the rotational temperature is calculated. Average intensity of each line was employed to calculate the rotational temperature and results are summarized in table 2.

## III. CALCULATIONS OF ROTATIONAL TEMPERATURE

Assuming the Maxwell Boltzmann distribution valid, the intensity of the rotational line can be given by the expression,
$\mathrm{I}_{\mathrm{J}^{\prime \prime}}=\mathrm{C} \mathrm{S}_{\mathrm{I}^{\prime \prime}} \exp \left[-\mathrm{F}_{\mathrm{v}^{\prime}}\left(\mathrm{J}^{\prime}\right) / \mathrm{k} \mathrm{T}_{\text {root }}\right] \ldots$
Where J ' and J " are the rotational quantum numbers of the upper and lower energy states. C is a constant and $\mathrm{SJ}^{\prime}{ }^{\prime}{ }^{\prime}$ is a HÖnl London factor [19]. $\mathrm{Fv}^{\prime}\left(\mathrm{J}^{\prime}\right)$ is the rotational energy in $\mathrm{cm}^{-1}$ for dimensionless factor of the exponential $\mathrm{Fv}^{\prime}\left(\mathrm{J}^{\prime}\right)$ is to be multiplied by hc $\mathrm{T}_{\text {rot }}$ is the rotational temperature and k is Boltzmann constant. For ${ }^{2} \Sigma-2 \Sigma$ transition J is replaced by K. The slope of the graph between $\ln \mathrm{I}^{\prime} \mathrm{K}^{\prime \prime} / \mathrm{S}^{\prime} \mathrm{K}^{\prime \prime}$ against $\mathrm{F}_{v^{\prime}}$ ( $\mathrm{K}^{\prime}$ ) is - Bvihc / $\mathrm{kT} \mathrm{T}_{\text {rot }}$.
In present work the R branch lines are chosen for intensity measurements, especially those which are free from overlap. The B-X system is a ${ }^{2} \Sigma-{ }^{2} \Sigma$ transition and so two P branches and two R branches are expected. Due to higher resolution it was possible to resolve the $R_{1}$ and $R_{2}$ components. The HÖnl London factor for ${ }^{2} \Sigma-{ }^{2} \Sigma$ transition is given by the equation,
$\mathrm{S} \mathrm{J}^{\mathrm{R}}=\left(\mathrm{J}^{\prime \prime}+1+\Lambda^{\prime \prime}\right)\left(\mathrm{J}^{\prime \prime}+1-\Lambda^{\prime \prime}\right) / \mathrm{J}^{\prime \prime}+1=\left(\mathrm{J}^{\prime}+\Lambda^{\prime}\right)\left(\mathrm{J}^{\prime}+\Lambda^{\prime}\right) / \mathrm{J}^{\prime}=\mathrm{J}^{\prime}$ (2)

For $R$ branch lines $J^{\prime}=\mathrm{J}+1$ i.e. $(\mathrm{K}+1)$ and $\mathrm{J} "=\mathrm{J}$ i.e. K Thus a graph of $\ln \left(\mathrm{I}^{\prime} \mathrm{r}^{\prime \prime} / \mathrm{J}^{\prime \prime}\right)$ vs $\mathrm{Bv}^{\prime} \mathrm{J}^{\prime}\left(\mathrm{J}^{\prime}+1\right)$ gives a slope -hc/ $\mathrm{kT}_{\text {rot. }}$ knowing all other quantities $\mathrm{T}_{\text {rot }}$ can be calculated.

Here, $\mathrm{J}^{\prime}=\mathrm{K}+1$ and $\mathrm{J}^{\prime \prime}=\mathrm{K}$, then on ordinate axis $\ln$ ( $\mathrm{Ik} /$ K ) is taken and on abscissa axis $\mathrm{Bv}^{\prime}(\mathrm{K}+1)(\mathrm{K}+2)$ is plotted. The expression for $\mathrm{T}_{\text {rot }}$ is $\mathrm{T}_{\text {rot }}=(\mathrm{hc} / \mathrm{k})(1 /$ slope $)$ $=1.439 /$ slope

## IV. RESULTS AND DISCUSSION

The vibrational temperature of AlO reported by Mentall and Nicholls [13] is $3600 \pm 400 \mathrm{~K}$ where they have used Laser produced plasma as an excitation source. A Ruby laser having output power of 2.5 J with pulse duration of the order of $500 \mu \mathrm{sec}$ was employed. The spectrum was recorded on a Bausch \& Lamb 1.5 m spectrograph having a reciprocal dispersion $15 \mathrm{~A}^{0} \mathrm{~mm}^{-1}$. A rotational temperature of AlO reported by Dors et al [14] is 3384 K . They used the laser ablation technique using a 266 nm lines from Nd: YAG laser. The spectrograph was 0.275 m Jarell Ash equipment fitted with Optical Multichannel Analyser (OMA). The rotational temperature of AlO using the arc source has yielded $\mathrm{T}_{\text {rot }}$ as $2880 \pm 100 \mathrm{~K}$, reported by Chaudhari et al which is lower, compared to that of Mentall and also of Dors et al. The rotational temperature of $0-1$ band of the $B^{2} \Sigma^{+}-\mathrm{X}^{2} \Sigma^{+}$system of AlO molecule measured using microwave discharge has shown still lower $\mathrm{T}_{\text {rot }}$, which is 1925 K which is agreement with Behere et al [16]. and Londhe et al [17].

## V. ACKNOWLEDGEMENT

The author express their sincere thanks to Dr. M.D. Saksena, Dr. K. Sunnanda and Dr. M.N. Deo, Bhabha Atomic research Centre, Trombay, Mumbai, for providing facilities of recording spectrum on an FT spectrometer and Dr. S. H. Behere, Professor, Department of Physics, Dr. B. A. M. University, Aurangabad for the helpful suggestions during this research work.
